

AGENTS.md â€™ Doc-Processor

INHERITED FROM the Helix Constitution

This module is governed by the Helix Constitution. All rules in the constitutionâ€™s AGENTS.md and the Constitution.md it references apply unconditionally. Locate the constitution from any nested depth via its `find_constitution.sh` helper â€™ do NOT hardcode a path (this module stays fully decoupled and project-agnostic per Â§11.4.28).

Canonical reference: <https://github.com/HelixDevelopment/HelixConstitution>

Module Identity

DocProcessor (`digital.vasic.docprocessor`, Go 1.25) is a standalone, project-not-aware, fully decoupled documentation-processing module. It loads project docs, builds structured feature maps, and tracks verification coverage for QA automation. Provider-specific and project-specific behaviour is injected at runtime via the `Translator`, `LLMAgent`, and `Config` contracts â€™ the module never imports a consuming projectâ€™s namespace.

Responsibilities

- Load and parse documentation (`pkg/loader`: Markdown, YAML, HTML, AsciiDoc, RST).
- Extract features and build a queryable `FeatureMap` (`pkg/feature`).
- Track per-feature verification coverage thread-safely (`pkg/coverage`).
- Build a directed inter-document link graph with JSON/Mermaid export (`pkg/docgraph`).
- Define the `LLMAgent` extraction contract and prompt templates (`pkg/llm`), with no hard dependency on any LLM provider.
- Externalise all user-facing strings (`pkg/i18n`) and load configuration (`pkg/config`).
- Expose a CLI: `docprocessor [-verbose|-v] <docs-directory>`.

Testing Boundaries

- Build: `go build ./...`. Vet: `go vet ./...` (zero warnings).
- Tests: `go test ./... -race -count=1` covers unit, integration, stress, security, E2E, and automation suites.
- Integration/stress/security/E2E/automation tests run against real filesystems and the real CLI binary, not mocks; unit tests may use mocks.
- Agents MUST NOT weaken, stub, or skip tests, and MUST NOT introduce a dependency on any consuming project. Every change keeps build and vet green.
